ABSTRACT

A flexible wiring board includes a printed
conductive circuit layer formed on an insulating film, a
metallic layer formed on the printed conductive circuit
5 layer, and an insulating layer formed on the metallic
layer. A method of making a flexible wiring board
includes the steps of forming a conductive circuit layer
by screen printing a wiring pattern using a conductive
paste, baking the printed wiring pattern, and forming a
10 metallic layer on the printed conductive circuit layer by
a plating method.
